

Joe Pronesti

Presents:

Nothing ordinary about Ordinary construction

"Nothing Ordinary about your Main Street Fire"

This program addresses leading insights and operational considerations for fires in buildings and occupancies of ordinary masonry, heavy timber, and loft construction that comprise the Main Streets of America. A much neglected topical area, this program brings into focus the broad issues and operational issues affecting historical construction characteristics, inherent hazards, building systems and components, and the corresponding strategic and tactical considerations that must be formulated based on the building's defining age, use, and conditions on arrival. This highly interactive presentation uses extensive case studies, field examples, interactive group simulations, and discussion points to provide the knowledge and skill set insight to operate in these building types efficiently and safely.

Joseph Pronesti is a 29 year veteran of the Elyria, Ohio (Northern Ohio) Fire Department; he is a graduate of the Ohio Fire Academy Executive Officer Program and currently serves as an Assistant Chief (Shift Commander). He writes a monthly column for Fire Engineering Webpage and also numerous articles for Fire Engineering Magazine. He is also a FDIC instructor.
